Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

Claim 8; SEQ ID NO 17352; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length CDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

```
sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3 'end sequence, where the oligonucleotide comprises at least is nucleotides and the combination of the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs asily without any specialised methods. AMP01366 to AAM13628 and AAM13631 to AAM13642 represent human amino acid sequences; and AAM13629 to AAM13621 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                     o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         360

The present invention describes a predictor set comprising a plurality of polynucleocides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of determining whether the cells comprising obtaining a sample of cells, correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels

correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polymuclectides and polypeptides that predict compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of a microarray of polymuclectides or polypeptides, and selecting polymuclectides or polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the polymuclectides have cytostatic activities, and can be used in gene therapy. The polymuclectides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining dentity to profile which aid in treating diseases and disorders (e.g. genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present content of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                              ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         287

The invention relates to 2175 novel human ovarian antigens (ABB41054-ABB43228) and to cDNAs encoding them (ABG54131-ABG56305), and also encompasses polypeptides 90% identical and polybrucleorides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen corrections and host cells comprising human ovarian antigen of ovarian antigens and the use of ovarian antigens and proposing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tunnous of ovarian or breast origin, reproductive system disorders (e.g., infertinity, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired condeficiencies, autoimmune ophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaenia), cardiovascular disorders and urinary system disorders, neurological disorders, gastrointestinal disorders and urinary system disorders, ovarian antigen polypeptides and of confine evarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies indentification of individuals and in forensic analysis, and the confine sequence data for this patent did electronic format directly from MIPO sequence data for this patent did electronic forme part of the printed sequence data for this patent did electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorthoea; endocrine disorder; infection; infinamatory condition; immune disorder; blood disorder; acardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antibofammatory; gynaecological; reproductive.

The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a treatment (MDDT) polypeptide (I) selected from a polypeptide having a treatment (MDDT) polypeptide (GMPP131.ABP13484) given in the sequence selected from 254 sequences (AMPP12131.ABP13484) given in the specification, a naturally occurring polypeptide comprising a sequence (I) or a biologically active or immunogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or modulates the activity of (I), and for preparing a polydonal or monoclonal antibody by hyptidems technology.

Nucleic acids (II) (ABD72449-ABD7200) encoding (I) are useful for screening a compound for effectiveness in altering expression of a target of polymucleotides and antibody by hyptidems technology.

Nucleic acids (II) (ABD72449-ABD7200) encoding (I) are useful for certification a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the expression of MDDT in a sample. A composition comprising (I), an agonist or antagonist is useful for treating a disease or condition associated with decreased or increased expression of functional MDDT. (I) or associated with decreased or increased expression of functional MDDT. Or (II) are useful for diagnosing, treating or preventing disorders are selected from a cell proliferative disorder and an associated with aberrant expression of MDDT, where the disorders are cirrhosis, hepatitis, poriasis, and cancer and an autoimmune/inflammatory disorder such as AIDS, Addison's disease, allowable of a tissue or cell cirrhosis, hepatitis. (II) are useful for creating drockin humanised animals or transgenic animals to model human disease; in somatic or type, for detecting differences in the chromosomal location due to commune. The expension or inversion among normal, carrier or affected individuals and annease.
                                                                                                                                                                                                                                                                                                          Jackson S, Lincoln SE, Altus CM, Dufour GE, Chalup MS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of slees expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                      301 KOOFPFHSAPALDVDWQSNNTFASCSTDMCIHVCKLGQDRPIKTFQGHTNEVNAIKWDPT 360

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                           Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine; peptide therapy, stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders, arthritis, inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID NO 18277; 1399pp + Sequence Listing; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Abgooulo-Abg30377 represent novel human diagnostic manno acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

Proteins of the invention and DNA sequences encoding them are given in records SERSESSES HERESSOR and ACCEOSO-ACCED94 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this pattent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete document is available on CD-ROM

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to 45 human intracellular signalling molecules (INTSIG), INTSIG-1 to INTSIG-45, and the cDNAs encoding them (ADA1319-ADA1408). The invention also encompasses expression constructs, host calls and transgenic organisms comprising an INTSIG nucleic acid sequence; the recombinant preparation of a INTSIG; an antibody against a INTSIG; eachods of detection of INTSIG proteins or nucleic acids; am micro-array containing INTSIG nucleic acids; methods of screening compounds for their ability to modulate INTSIG acitvity or expression; and pharmaceutical compositions comprising an INTSIG protein, an INTSIG antibody, an INTSIG aponist or INTSIG antagonist. The INTSIG proteins, mucleic acids or compositions comprising them are useful in diagnosing, treating or compositions comprising them are useful in diagnosing, treating or preventing a variety of disorders, including cell proliferative disorders (e.g., AIDS, allergies, anaemia, asthma, Dronchitis, gout, multiple sclerosis, osteoarthritis, rheumatoid arthritis, or systemic lupus cervitemancosus; neurological disorders (e.g., epilepsy, stroke, alloredies disorders (e.g., epilepsy, stroke, Alzheimer's disease); viral, bacterial, comparation, or parkinson's disease); developmental disorders (e.g., achondroplastic dwarfism, cushing's disease, hypothyroidism or hydrocephalus); endocrine disorders (e.g., disorders of the hypothalamus or pituitary gland or disorders (e.g., disorders of the hypothalamus or pituitary gland or clabetes); reproductive disorders; or vesicle-trafficking disorders (e.g., represents an INTSIG protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  247

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences. (ABL01840-ABL16175) and the encoded proteins (ABBS7077-ABR2072). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                110 GHAEAVVSLNPSPDGAHLASGSGDTTVRLWDLNTETPHFTCTGHKOWVL--CVSWAPDGK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -EGGQD-----VPSNKDVTSLDW-----NSEGTLLATGSYDGFAR

modified Notch signalling activity in a variety of Notch-dependent signalling process in both Drosophila and Xenopus embryos. The Notchless protein has a novel highly conserved N-terminal domain followed by 9 MP40 repeats. Notchless, and nucleic acids encoding it, can be used in methods for the diagnosis and therapy of certain diseases, particularly cancer and neurodegenerative diseases (claimed). A Notchless mutant in a sensitised Notch genetic background is used in a claimed method for identifying compounds capable of modifying the levels of expression or activity of a Notch protein

Notchless was identified in a screen for dominant modifiers of a Notch mutant phenotype in the Drosophila wing. The mutant dominantly suppressed the wing notching phenotype of notchind mutations, and the Notchless protein was shown to bind to the cytoplasmic domain of Notch. Notchless

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in alucidating cell signalling and call-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The T2ap gene is involved in T cell activation, and in the modulation of immune responses. T2ap polynucleotides and polypeptides are useful for diagnosing or treating acute and chronic diseases involving T cell activation and Th1 and Th2 immune response, for the treatment of acute and chronic rejection of allotad exact transplants and bone marrow transplantation, for the treatment of rheumatoid arthritis, lupus erythematosis, multiple sclerosis, encephalitis, vasculitis, diabetes mellitus, pancreatitis, assoritis, thyroiditis, for the treatment of malignant disorders of T, B or NK cells, for the treatment of malignant disorders of T, B or NK cells, for the treatment of malignant disorders of T, B or NK cells, for the treatment of skin tumours, adrenal tumours or lung tumours, wound healing, growth disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      220
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      169

-! FUNCTION: Antagonizes telomeric silencing in yeast. May recruit genes Dev. 15:2991-3004 (2001).

-! FUNCTION: Antagonizes telomeric silencing in yeast. May recruit SIR4 to nontelomeric sites or repression.

-! SUBURT: Interacts with SIR4 amino-terminal domain. Interacts with a complex composed of SIN3 and RPD3. Identified in the Set3C complex with HOS2, HST1, SNN1, CPR1, HOS4/YIL112W and SET3.

-! SUBCELLULAR LOCATION: Nuclear.

-! SIMILARITY: Contains 1 Lish domain.

-! SIMILARITY: Contains 7 WD repeats.
                                                                                                                                                                                                                                                                                                         Mannhaupt G., Stucka R., Ehnle S., Vetter I., Feldmann H.; "Analysis of a 70 kb region on the right arm of yeast chromosome II."; Yeast 10:1363-1381(1994).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in dormant spores and growing cells, but increases during spore-germination and multicellular development.
MISCELIANEOUS: Several proteins derive from AAC-rich mRNA, whi due to a frameshift also have ACA and CAA codons and thus are Asn-, Thr- or Gln-rich.

"Complete genomic sequence of the filamentous nitrogen-fixing

cyanobacterium Anabaena sp. strain PCC 7120.";

In SIMILARITY: Contains 1 NB-ARC domain.

-: SIMILARITY: Contains 15 WD repeats.
                                                                             68;
       Length 1356;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cyanobacteria; Nostocales; Nostocaceae; Nostoc.
